

SurveyMonkey Implementation to create survey data using API:

- Login to 'https://www.surveymonkey.com/' and design a survey as per your requirements.

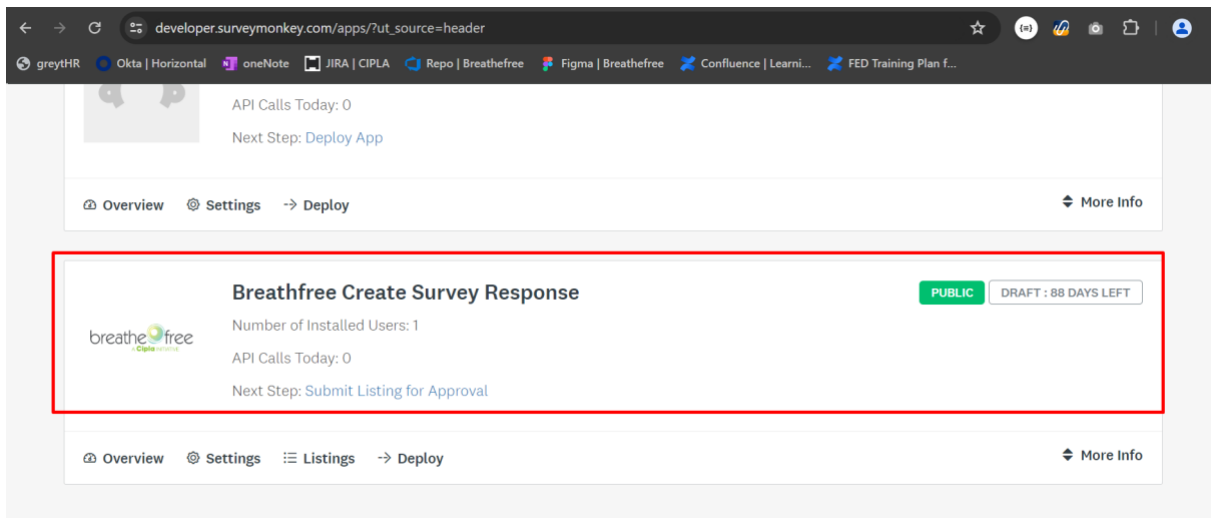

I have created the below test survey :

- Add collector to your survey to get the embedded code to integrate it with your NextJs application

- Login to 'https://developer.surveymonkey.com/' and create an application for authorization purpose:

- Check the settings and request the scopes as in below screenshot:

Breathfree Create Survey Response

Quota Limits
500 / day : 120 / minute

Daily Quota Usage 0 / 500

Scopes

Set the **scope** requirements for your application. Scopes allow your application to access resources on behalf of users. If a scope is required, users must approve it for OAuth to succeed. If a scope is optional, users do not need to approve it for OAuth to succeed, but your application will not be able to access resources controlled by scopes that aren't approved. If your application uses scopes that require a [paid SurveyMonkey plan](#), users will need a paid plan to use your application. [Read more about scopes.](#)

NOTE: Changes made to the scope will be immediately applied to the access token shown above in the credentials section. For your application users, they will need to re-authenticate to access new scopes.

Update Scopes

- Now You can simply refer this developer documentation to call the api endpoints as per requirements:
'https://developer.surveymonkey.com/api/v3/?ut_source=header#SurveyMonkey-Api'

Steps to create a response using SurveyMonkey API:

1. Get Survey to list all the surveys in your application:

(Use the '{access-token}' from the above application settings)

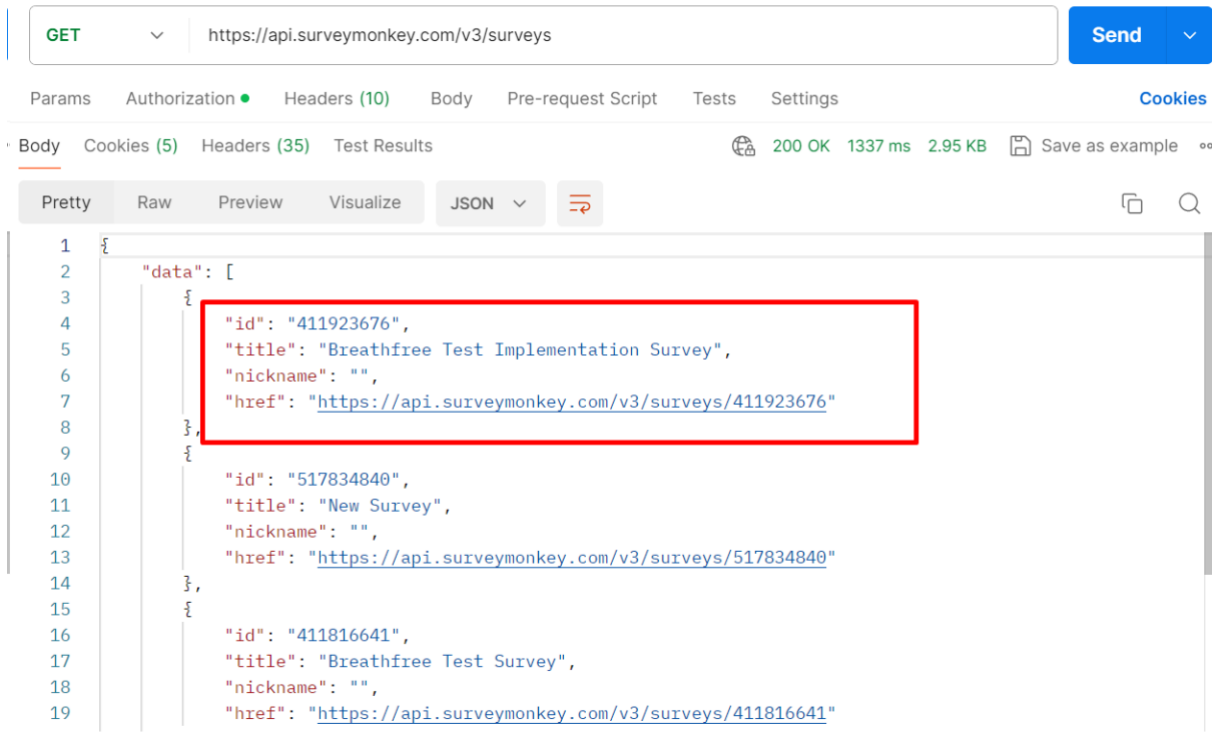

The image shows two side-by-side screenshots. The left screenshot is from the SurveyMonkey API documentation for the GET /surveys endpoint. It lists available methods: HEAD (checks resource availability), OPTIONS (returns methods and options), GET (returns a list of surveys), and POST (creates a new survey or updates an existing one). It also includes a table for optional query strings for the GET method.

Name	Type	Required	Description
page	string	false	Which page of resources to return. Defaults to 1

The right screenshot shows a cURL command in Postman, highlighted with a red box. The command is: `curl --request GET \ --url https://api.surveymonkey.com/v3/surveys \ --header 'Accept: application/json' \ --header 'Authorization: Bearer {access-token}'`

```
"curl --request GET \  
--url https://api.surveymonkey.com/v3/surveys \  
--header 'Accept: application/json' \  
--header 'Authorization: Bearer {access-token}'"
```

RESPONSE:

Here you can get the Survey list with their id's in response Json.

2. Get survey collectors using survey id:

NAV GET /surveys/{survey_id}/collectors

GET /surveys/{survey_id}/collectors

Available Methods

- HEAD: Checks if resource is available
- OPTIONS: Returns available methods and options
- GET: Returns a list of collectors for a given survey. Public App users need access to the [View Collectors scope](#)
- POST: Creates an [sms](#), [weblink](#), [email collector](#) or [popup collector](#) for a given survey. Public App users need access to the [Create/Modify Collectors scope](#)

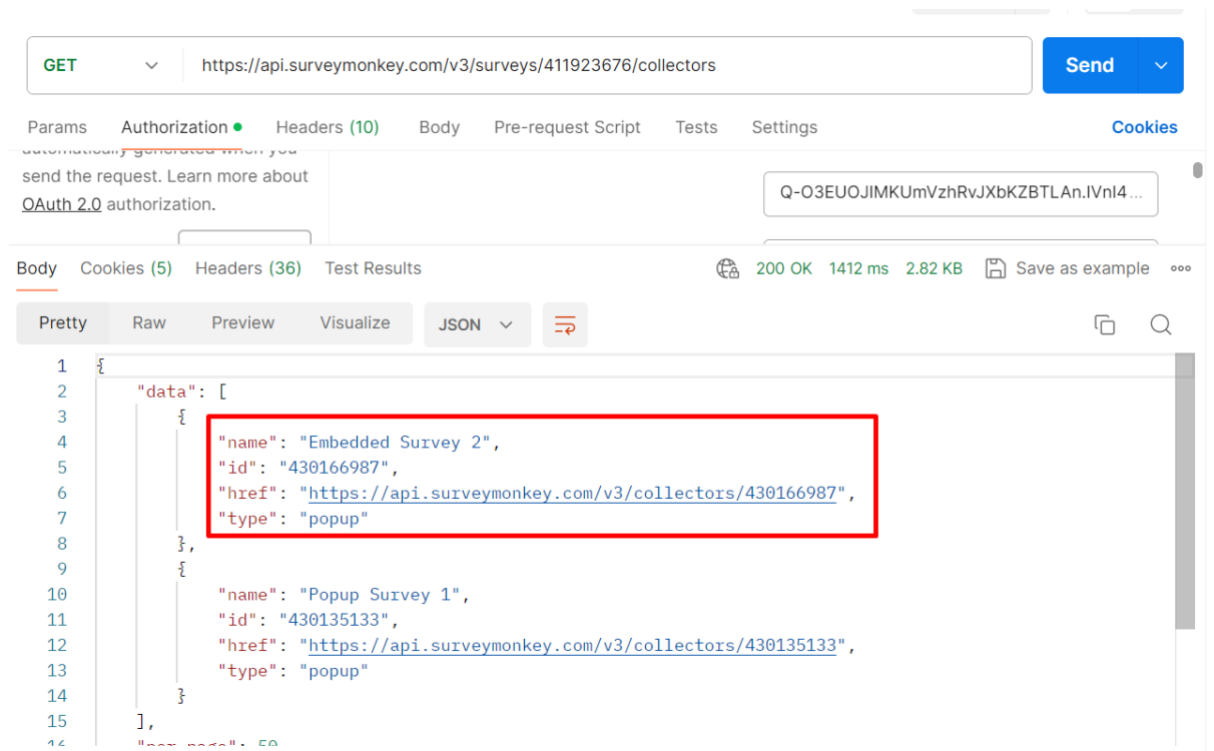

Optional Query Strings for GET

Name	Type	Required	Description
page	integer	false	Which page of resources to return. Defaults to 1
per page	integer	false	Number of resources to return per page

Code samples

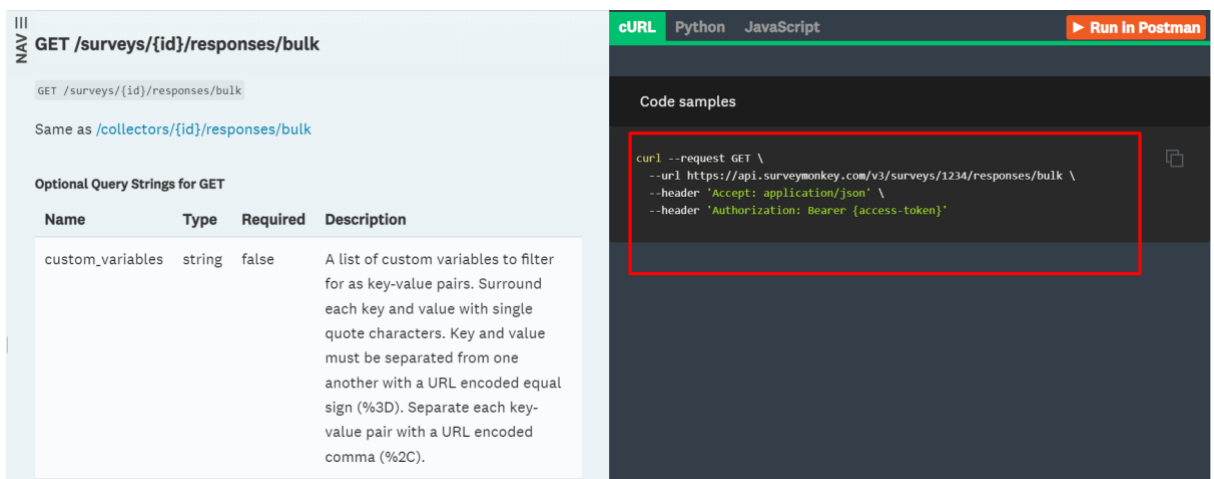

```
curl --request GET \
--url https://api.surveymonkey.com/v3/surveys/1234/collectors \
--header 'Accept: application/json' \
--header 'Authorization: Bearer {access-token}'
```

RESPONSE:

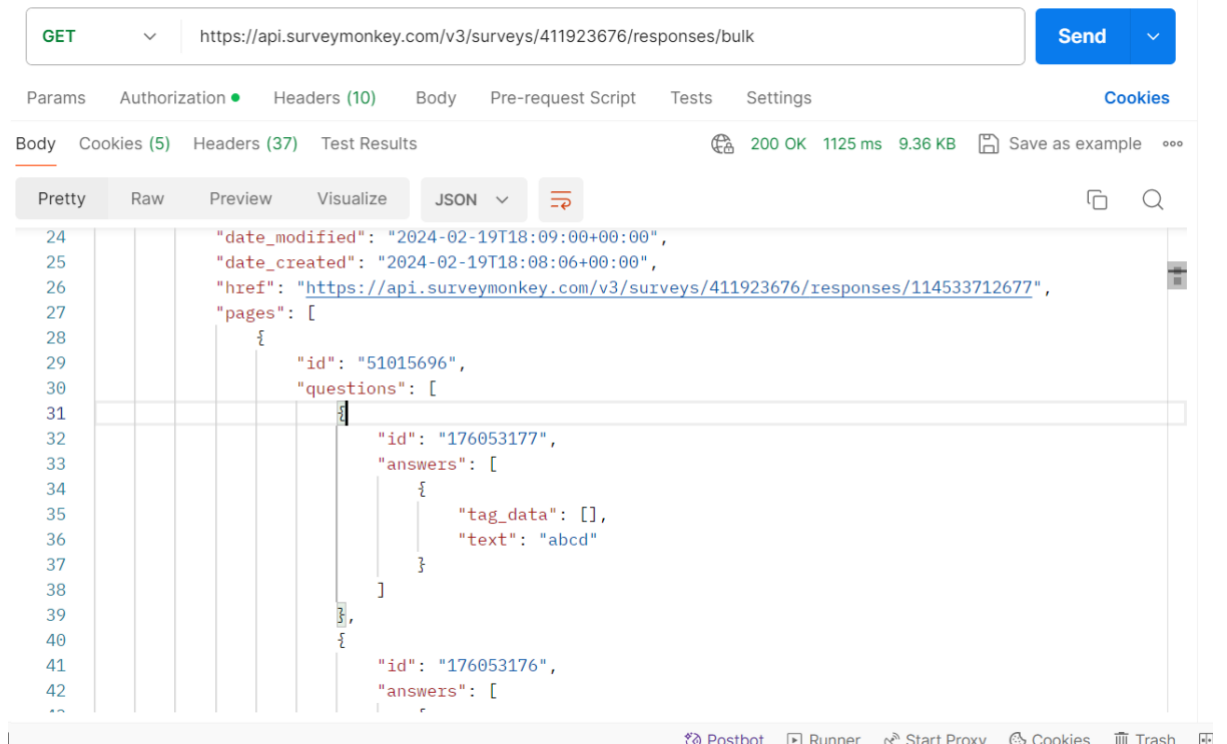

We can get the collector id's from the response.

3. Get Demo response to get the Form field id's and response structure:

RESPONSE:

Get the Response structure and “pages” array to get the response structure including respective Question and answer ids with data. Refer Example Structure:

```

"pages": [
  {
    "id": "51015696",
    "questions": [
      {
        "answers": [
          {
            "choice_id": "1279898337"
          }
        ],
        "id": "176053176"
      },
      {
        "answers": [
          {
            "text": "lets check the functionality via postman"
          }
        ],
        "id": "176053178"
      }
    ]
  }
]

```

4. Create the response using collector id:

POST /collectors/{id}/responses

Request Body for POST /collectors/{id}/responses

Name	Type	Required	Description
custom_variables	object	false	Values to any available custom variables in the survey
custom_value	string	false	A custom value to attach to the response for a weblink collector
date_created	DateString	false	Date the response was created
response_status	string	false	Status of the response: completed, partial, overquota,

Code samples

```
curl --request POST \
--url https://api.surveymonkey.com/v3/collectors/1234/responses \
--header 'Accept: application/json' \
--header 'Authorization: Bearer {access-token}' \
--header 'Content-Type: application/json' \
--data '{"custom_variables": {}, "custom_value": "", "date_created": "2015-12-28T21:57:14+00:00"}'
```

Body parameter

```
{
  "custom_variables": {},
  "custom_value": "",
  "date_created": "2015-12-28T21:57:14+00:00",
  "response_status": "completed",
  "ip_address": ""
}
```

Response :

POST https://api.surveymonkey.com/v3/collectors/430166987/responses

```

```

Response code 201 predicts that the response data is inserted successfully. You can check survey monkey portal to analyze results.

NOTE:

Refer the example Json schema to pass in body parameter while posting the API call(pass the required parameters like **page_id**, **question_id** and **choice_id** before posting the data):

Example-json.json
